203 Type IV/V Incident Management Team Training (IMT)

Using classroom lecture and simulated incidents, the student will understand the role and function of an incident management team, the applicability of management principles to the incident management job and the special considerations of incident management within geographic areas of the Commonwealth. Course objectives are to train command staff positions to function as qualified local incident management teams who are able to assist in the management of large or highly complex all hazard incidents. The focus of the course is to better prepare team members within the local jurisdiction to address the unique and challenging management needs associated with these kinds of incidents within the jurisdiction.

This class offers a solid review of the ICS/IMT tools to get students started writing Incident Action Plans and commanding and controlling incident scenes and will incorporate “hands-on training” with intense practice of command and control while writing Incident Action Plans for Type IV/V scenarios where each person will rotate from on-scene roles.

PRE-REQUISITES/EQUIPMENT NEEDED

This course is open to rescue, fire, emergency medical, emergency management, public health and law enforcement personnel or any organization wishing to be part of the local incident management team. Students must have completed IS-100, IS-200, IS-700, IS-800 and ICS-300. Priority will be given to those individuals that serve as a supervisor within an organization responsible for mitigating Type IV/V incidents. Students will need to bring a pen and paper and it is recommended students bring a personal laptop (if possible).

This 2-day course will be offered Thursday-Friday.

Lead Instructor: Todd Schulkers, State Fire Rescue Training District 7
